

# Introduction to Algorithms

## Lecture 5

By: Darmen Kariboz

A series of horizontal lines of varying lengths and colors (teal, light blue, and white) extending from the left edge of the slide towards the right, positioned below the author's name.

# Outline - Geometry

- Point in Plane
- Line equation
- Distance between Point and line
- Intersection of two lines
- Point in a Triangle
- Polygon area

# Point in Plane

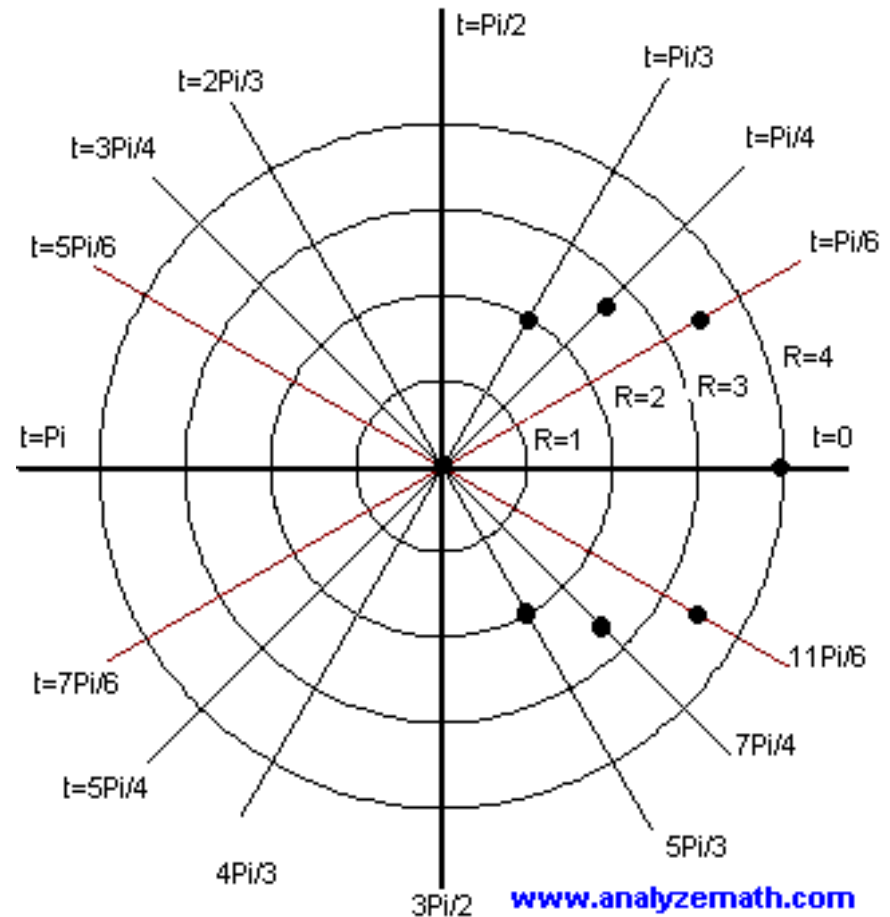

Every point in Descartes system is represented as two coordinates  $X$  and  $Y$ .

# Polar system

- In mathematics, the **polar coordinate system** is a two-dimensional coordinate system in which each point on a plane is determined by a distance from a fixed point and an angle from a fixed direction.

- $X = r \cdot \cos(\alpha)$
- $Y = r \cdot \sin(\alpha)$

# Line Equation

Line equation is an equation that describes line in a plane.

$$Ax + By + C = 0$$

# Line equation

- If two coordinates are given, line equation can be found.
- $A = y_1 - y_2$
- $B = x_2 - x_1$
- $C = -(x_1 * A + y_1 * B)$

-

# Distance between point and Line

To find distance between line and point. You need to find **normal vector** to point.

# Find distance between point and line

- Distance from  $(X_0, Y_0)$ , to line can be found by given formula. 
$$\frac{|ax_0 + by_0 + c|}{\sqrt{a^2 + b^2}}.$$

# Intersection of two lines

Problem is to find coordinates of point, where two lines intersect

# Intersection

- If lines are given in terms of line equations:

$$\mathbf{A1*x+B1*y+C1=0 \text{ and}}$$

$$\mathbf{A2*x+B2*y+C2=0}$$

- if  $(A1*B2 - A2*B1 \neq 0)$  then
- $x=(C1*B2-C2*B1)/(A1*B2-A2*B1)$
- $y=(A1*C2-A2*C1)/(A1*B2-A2*B1)$

# Point in a triangle or not?

Problem is to determine if the given point inside the triangle or outside

# By Heron's Formula

by Herone:

$$p = (a+b+c)/2$$

$$\text{area} = \text{sqrt}(p(p-a)(p-b)(p-c))$$

$x_1, y_1$

$c$

$a$

$b$

$x_3, y_3$

$x_2, y_2$

$$\text{dist} = \text{sqrt}((x_2-x_3)*(x_2-x_3) + (y_2-y_3)*(y_2-y_3))$$

# By Line Equation

$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} \quad Ax + By + C = 0$$

formula of a line

$$(x - x_1)(y_2 - y_1) = (x_2 - x_1)(y - y_1)$$

$$(x - x_1)(y_2 - y_1) - (y - y_1)(x_2 - x_1) = 0$$

$$x(y_2 - y_1) - x_1(y_2 - y_1) - y(x_2 - x_1) + y_1(x_2 - x_1) = 0$$

$$x(y_2 - y_1) + y(x_1 - x_2) + y_1(x_2 - x_1) - x_1(y_2 - y_1) = 0$$

$$A = y_2 - y_1$$

$$B = x_1 - x_2$$

$$C = -B * y_1 - A * x_1$$

$$\text{sign} = A * x_3 + B * y_3 + C$$

sign > 0	left side
sign < 0	right side
sign = 0	on a line

# By Line Equation

# Polygon Area

Polygon(let's say convex polygon)  
is given by list of all corners  
coordinates in clockwise order.

## Area of polygon(by Heron's Formula)

- Find central point of polygon(x,y)
- Find sum of all triangles formed by central point and each edge of polygon.
- Heron's formula:

$$\mathbf{A} = \sqrt{\mathbf{s}(\mathbf{s} - \mathbf{a})(\mathbf{s} - \mathbf{b})(\mathbf{s} - \mathbf{c})}$$

$$\mathbf{where\ s} = \frac{1}{2}(\mathbf{a} + \mathbf{b} + \mathbf{c})$$

# Area of Polygon

A method for finding the area of any polygon when the coordinates of its vertices are known.

General formula:

$$\left| \frac{(x_1y_2 - y_1x_2) + (x_2y_3 - y_2x_3) + \dots + (x_ny_1 - y_nx_1)}{2} \right|$$

# Example

	x	y
A	4	10
B	9	7
C	11	2
D	2	2
A	4	10

28	-	90	=	-62
18	-	77	=	-59
22	-	4	=	18
20	-	8	=	12

**Total -91**

$$\text{Area} = |-91 / 2| = 45.5$$

# Home Work

- **Polygon area**
- Compare two formulas of finding polygon areas.  
Output both values for given polygon.
- **Find intersection of two lines in 3D.**
- Given two lines. Each having 6 integer values.  
Describing lines in 3d.

# Midterm next week

- During Lecture
- Lectures 1-5
- Paper based
- Theoretical Questions as well as Practical
- 5 Students with best results will go to OzYurt
